# Python Data Types

Numpy

#### **Numpy Basics**

- N-Dimensiomnal array data structure
- comprehensive mathematical functions, random number generators, linear algebra routines, Fourier transforms, etc.
  - Scientific computing

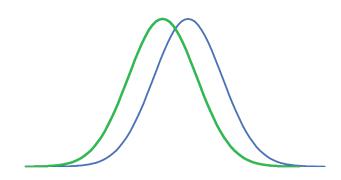

```
# Create a 1-Dimensional array
temperature = np.array([60,70,80,90,100])
customer = np.array([100, 150, 180, 190, 195])
type(customer)
temperature.mean()
print("temperature data collected = ",temperature)
print("customer data collected = ", customer)
temperature[0]
# Correlation Analysis - Generate correlation matrix
np.corrcoef(temperature, customer)
Temp_Cust_2D = np.array([(60,70,80,90,100),(100, 150, 180, 190, 195)])
print (Temp_Cust_2D)
Temp_Cust_2D[0,2]
# Element wise operation - not possible on List data type
Temp_Cust_2D = Temp_Cust_2D*4
print (Temp Cust 2D)
# Using Numpy Random number generator to generate a 2 dimensional array
TempCust = np.array([np.random.randint(50,100,20), np.random.randint(10,200,20)])
TempCust
correlMatrix=np.corrcoef(TempCust[0], TempCust[1])
```

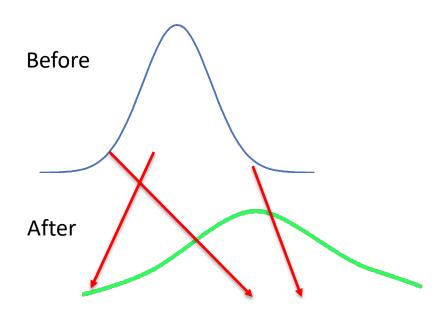

import numpy as np

print (correlMatrix)

## T-Test

• A test of statistical differences

#### Independent Sample T-Test

$$t=rac{m_A-m_B}{\sqrt{rac{S^2}{n_A}+rac{S^2}{n_B}}}$$

m = mean

n = size

 $S^2$  = estimator of the common variance of the two samples

$$S^2 = rac{\sum (x - m_A)^2 + \sum (x - m_B)^2}{n_A + n_B - 2}$$

$$df = n_A + n_B - 2$$

0.1%

if the absolute value of the t-test statistics (|t|) is greater than the critical value, then the difference is significant.

Paired Sample t-test  $t=rac{m}{s/\sqrt{n}}$ 

d = the differences between all pairs
m = mean of the difference (d)

s = standard deviation of the difference (d) n = size of d

n = size of d df = n - 1

If the absolute value of the t-test statistics (|t|) is greater than the critical value, then the difference is significant.

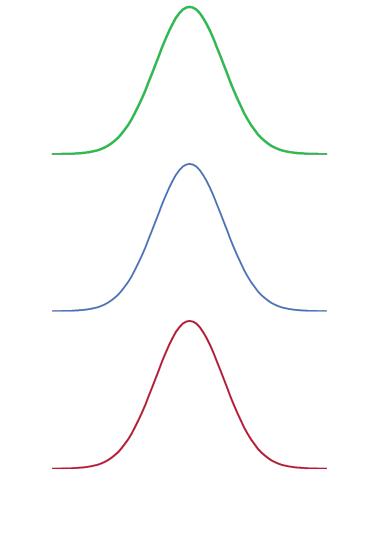

The average of the difference d is compared to 0. If there is any significant difference between the two pairs of samples, then the mean of d is expected to be far from 0.

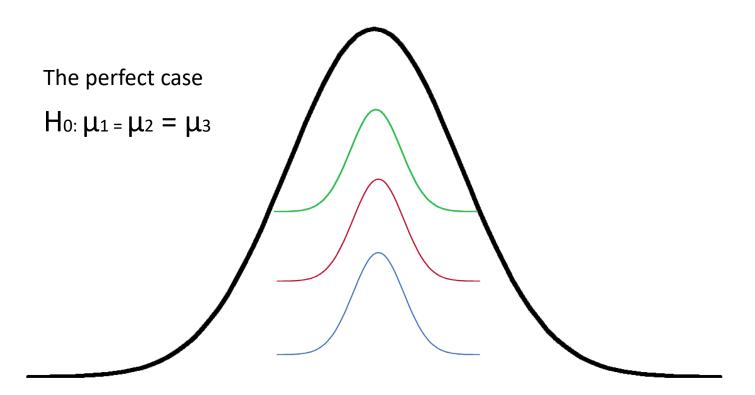

#### William Sealy Gosset

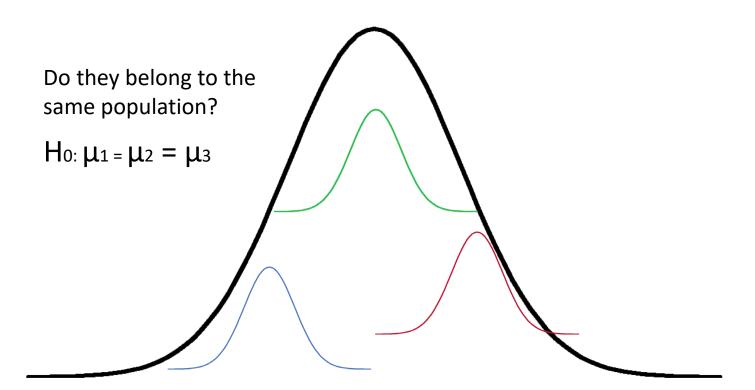

- Guinness Brewery
- Differences between barley yields

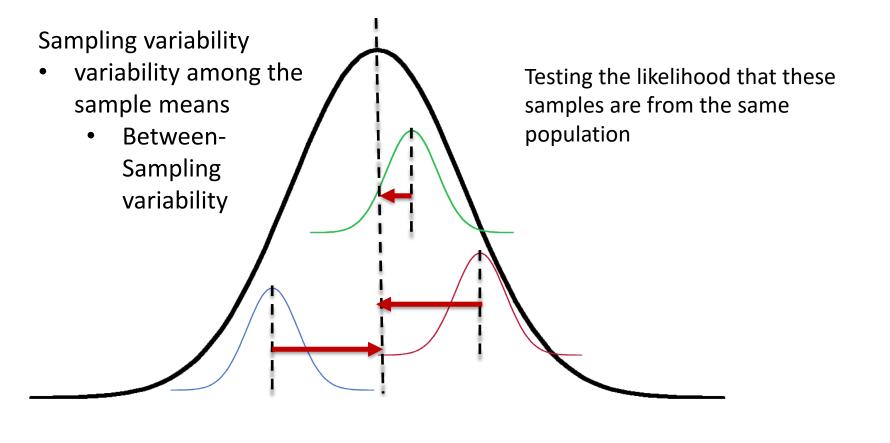

## **ANOVA**

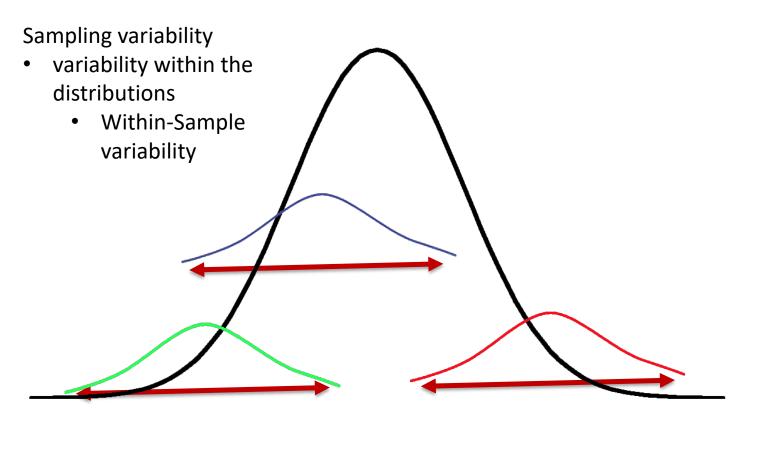

- An Analysis of Variance
  - Compare the means of more than two groups, samples, populations

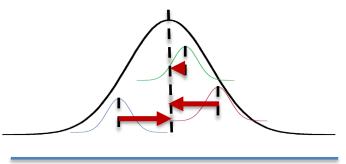

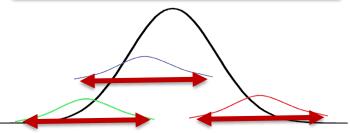

#### ANOVA =

variability among the sample means

variability within the distributions

## Signal

## Noise

### Independent Sample T-Test: Comparing Two Groups

 Professor Huang is teaching two data science classes. One of these classes is delivered online and the other one is delivered in person on campus.

# Steps

- Determine 1-tail or 2-tail test
- Determine if the groups are paired or unpaired
- Determine equal Variance or unequal variance

    EqualVar = False
  else:
    EqualVar = True
else:
  if (ScoreArr[1].std() / ScoreArr[0].std()) > 2:
    EqualVar = False
  else:
    EqualVar = True
# Obtain T-Stat and Pvalue
SampleT = ttest ind(ScoreArr[0], ScoreArr[1], equal var=EqualVar)
SampleT.pvalue
```

## Paired Sample T-Test

 Professor Huang wants to know student's performance before and after taking the course.

Student	Pre-Test	Post-Test	
	1	51	82
	2	47	98
	3	36	84
	4	54	88
	5	51	85
	6	51	99
	7	66	86
	8	63	95
	9	68	89
	10	36	97
	11	46	81
	12	64	93
	13	41	91
	14	64	96
	15	50	89
	16	46	92
	17	62	88
	18	64	98
	19	35	82
	20	57	98

# Steps

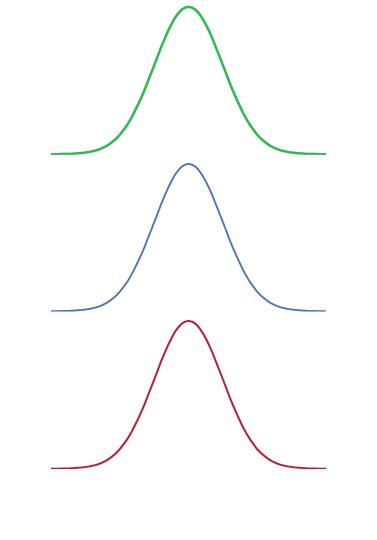

- Determine 1-tail or 2-tail test
- Determine if the groups are paired or unpaired

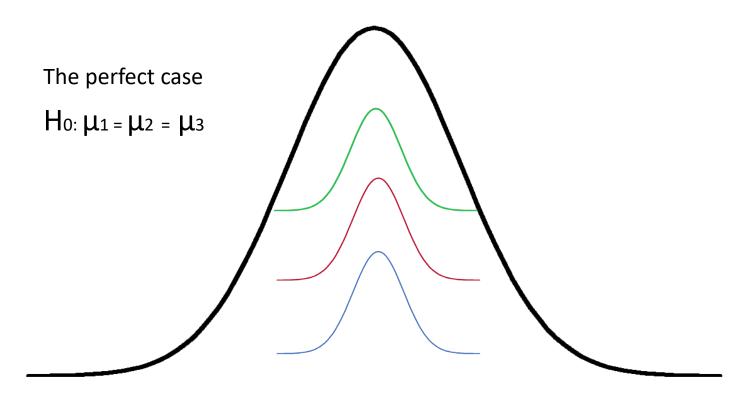

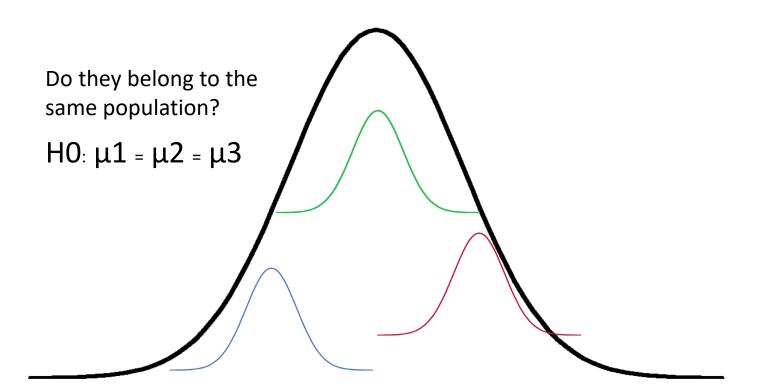

```
# read Excel or CSV File
import pandas as pd
# Store Columns as Arrays
import numpy as np
# Perform Paired-Samples T-Test
from scipy.stats import ttest rel
# Load sample data file
df = pd.read csv ("Huang Class Differences.csv")
# Convert df columns to individual arrays
Student= np.array(df["Student"])
PreTest= np.array(df["Pre-Test"])
PostTest= np.array(df["Post-Test"])
print("student array = ", Student)
print("pre-test array = ", PreTest)
print("post-test array = ", PostTest)
# Compare Means - Paired Samples T-Test
PairedT = ttest rel(PreTest,PostTest)
print(PairedT)
if PairedT.pvalue < 0.05:
  print("Performamnce of InPerson Students and Online Students are Different")
else:
  print("Performamnce of InPerson Students and Online Students are the same")
```

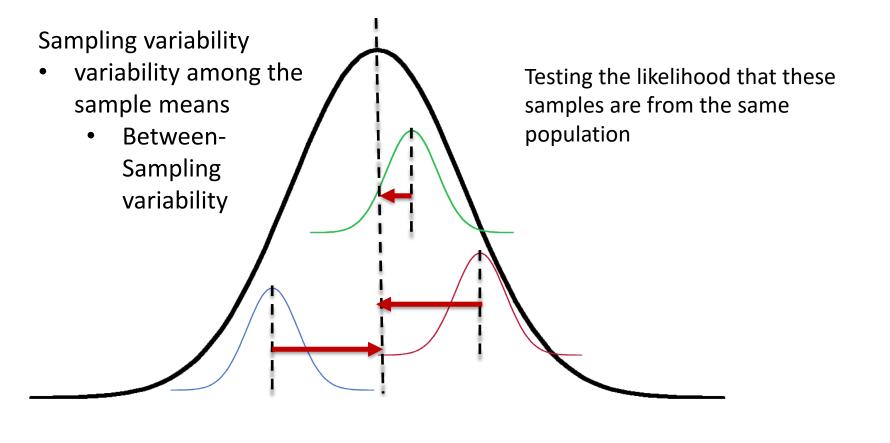

## **ANOVA**

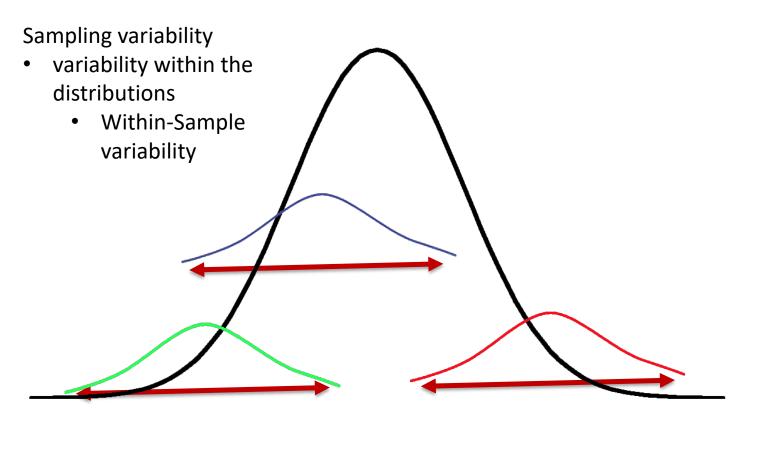

- An Analysis of Variance
  - Compare the means of more than two groups, samples, populations

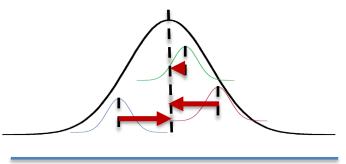

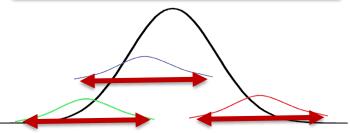

#### ANOVA =

variability among the sample means

variability within the distributions

## Signal

## Noise

## Oneway ANOVA

#### Data Science: Comparison

Professor Huang is teaching three data science fundamentals classes. One of these classes is delivered online, the second one is delivered in person on campus, and the third one is a hybrid class. Professor Huang wants to know if there are differences in performance due to the delivery platform.

## **ANOVA**

### **ANOVA**

```
import pandas as pd
import scipy.stats as st

# Read data stored in csv file
df = pd.read_csv("differences3.csv")

# assign label to each student type: Online, InPerson, Hybrid
df["Student"].replace({1:"Online", 2:"InPerson", 3:"Hybrid"}, inplace=True)

# Oneway ANOVA
rdf = st.f_oneway(df["Score"][df["Student"]=="Online"], df["Score"][df["Student"]=="InPerson"], df["Score"][df["Student"]=="Hybrid"])
```

print ("ANOVA Results: ", rdf)

### **ANOVA**

ANOVA Results: F\_onewayResult(statistic=1.251646103688551, pvalue=0.2937751293444691)

If sig (p-value) < 0.05, then we reject null hypothesis. Therefore, we conclude that significant difference exists.

If sig > 0.05, then we accept the null hypothesis.

```
import pandas as pd
# For oneway ANOVA
import scipy.stats as st
```

print ()

print (posthoc)

## ANOVA with Post Hoc

```
# For Post Hoc
from statsmodels.stats.multicomp import pairwise tukeyhsd
from statsmodels.stats.multicomp import MultiComparison as multi
# Read data stored in csy file
df = pd.read csv("differences3.csv")
# assign label to each student type: Online, InPerson, Hybrid
df["Student"].replace({1:"Online", 2:"InPerson", 3:"Hybrid"}, inplace=True)
# Oneway ANOVA
rdf = st.f oneway(df["Score"][df["Student"]=="Online"], df["Score"][df["Student"]=="InPerson"], df["Score"][df["Student"]=="Hybrid"])
print ("ANOVA Results: ", rdf)
# Post Hoc
mc = multi(df["Score"], df["Student"])
posthoc = mc.tukeyhsd()
```
